# 6.3000: Signal Processing

# **Superposition and Convolution**

$$y(t) = (h * x)(t) = \int h(\tau)x(t - \tau) d\tau$$

$$y[n] = (h * x)[n] = \sum h[m]x[n-m]$$

Aging and blending wines from different crops.

Start with 3 barrels of wine: newest at left, oldest at right.

Aging and blending wines from different crops.

Sell half of the oldest stock.

Aging and blending wines from different crops.

Refill oldest barrel from next-to-oldest barrel.

Aging and blending wines from different crops.

Refill next-to-oldest barrel from youngest barrel.

Aging and blending wines from different crops.

Refill youngest barrel with this year's harvest.

Aging and blending wines from different crops.

Old and new contents mix; ready for next year.

Aging and blending wines from different crops.

Old and new contents mix; ready for next year.

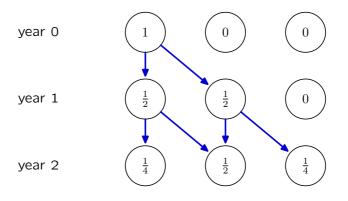

Properties of solera process:

- Mixing produces a more uniform product.
- Mitigates worst-case results of one bad year.
- Blends wines from MANY previous years.

We can analyze these effects with a tracer experiment.

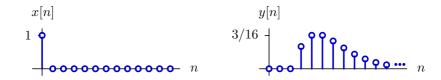

Add 1 unit of tracer to new crop; track tracer through the system.

How much tracer will be in each barrel at the end of year 3?

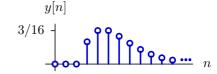

Add 1 unit of tracer to new crop; track tracer through the system.

$\operatorname*{Year}{n}$	Tracer in $x[n]$	Barrel #1	Barrel #2	Barrel #3	Tracer out $y[n]$
0	1	1	0	0	0
1	0	1/2	1/2	0	0
2	0	1/4	2/4	1/4	0
3	0	1/8	3/8	3/8	1/8
4	0	1/16	4/16	6/16	3/16
5	0	1/32	5/32	10/32	6/32
6	0	1/64	6/64	15/64	10/64

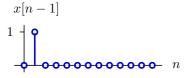

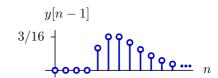

How would results change if tracer were added in year 1 (not 0)? Original response:

Delayed input  $\rightarrow$  delayed output:

Delaying the input by a year simply delays the outputs by one year.

#### **Time-Invariance**

A system is time-invariant if delaying the input to the system simply delays the output by the same amount of time.

Given

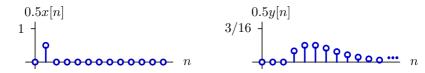

the system is time invariant if

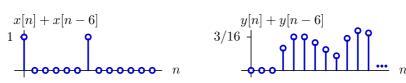

$$x[n-n_0] \longrightarrow$$
 system  $\longrightarrow y[n-n_0]$ 

is true for all  $n_0$ .

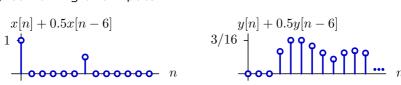

Scaling the input amplitudes:

Adding two inputs:

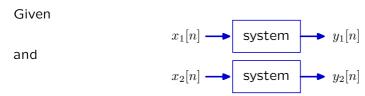

Linearly combining two inputs:

### Linearity

A system is linear if its response to a weighted sum of inputs is equal to the weighted sum of its responses to each of the inputs.

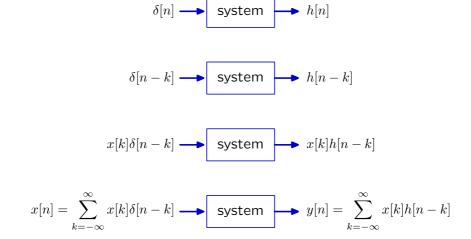

the system is linear if

$$\alpha x_1[n] + \beta x_2[n]$$
 system  $\rightarrow \alpha y_1[n] + \beta y_2[n]$ 

is true for all  $\alpha$  and  $\beta$ .

#### Convolution

If a system is linear and time invariant, the response to an arbitrary input is the convolution of that input with the unit-sample response.

### **Check Yourself**

For solera process ...

Year	Tracer in			Barrel	Tracerout
n	x[n]	#1	#2	#3	y[n]
0	1	1	0	0	0
1	0	1/2	1/2	0	0
2	0	1/4	2/4	1/4	0
3	0	1/8	3/8	3/8	1/8
4	0	1/16	4/16	6/16	3/16
5	0	1/32	5/32	10/32	6/32
6	0	1/64	6/64	15/64	10/64

How much tracer would be found in output from year 5, if one unit of tracer is added in years 0, 1, and 2?

1.  $\frac{21}{32}$ 

2.  $\frac{1}{2}$ 

3.  $\frac{3}{16}$ 

4.  $\frac{9}{16}$ 

5. none of above

### **Check Yourself**

For solera process ...

Year	Tracer in $x[n]$	Barrel #1	Barrel #2	Barrel #3	Tracer out $y[n]$
n	x[n]	#-± 1	#-Z	#-3 ^	y[n]
1	0	1/2	1/2	0	0
2	0	1/4	2/4	1/4	0
3 4	0	1/8 1/16	3/8 4/16	3/8 6/16	1/8 3/16
5	0	1/32	5/32	10/32	6/32
6	0	1/64	6/64	15/64	10/64

How much tracer would be found in output from year 5, if one unit of tracer is added in years 0, 1, and 2?  $^{2}$ 

1	21
Ι.	$\overline{32}$

2. 
$$\frac{1}{2}$$

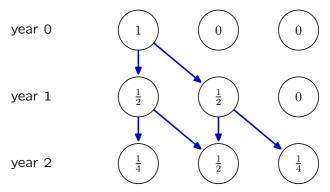

3. 
$$\frac{3}{16}$$

4. 
$$\frac{9}{16}$$

5. none of above

The content of barrel #3 has no direct dependence on barrel #1.

The new content of barrel #3 depends only on itself and barrel #2. All dependence on barrel #1 is through barrel #2.

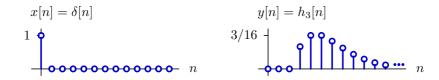

Since barrel #3 depends only on barrel #2, and barrel #2 depends only on barrel #1, the three barrel system is equivalent to the cascade of three one barrel systems!

Making a three-barrel system by cascading three one-barrel systems.

Year	Tracer in	Barrel	Barrel	Barrel	Tracer out
n	$x[n] = \delta[n]$	#1	#2	#3	$y[n] = h_3[n]$
0	1	1	0	0	0
1	0	1/2	1/2	0	0
2	0	1/4	2/4	1/4	0
3	0	1/8	3/8	3/8	1/8
4	0	1/16	4/16	6/16	3/16
5	0	1/32	5/32	10/32	6/32
6	0	1/64	6/64	15/64	10/64

Find the unit-sample response  $h_1[n]$  for a 1-barrel solera.

Show that  $h_3[n] = ((h_1 * h_1) * h_1)[n].$ 

Find the unit-sample response  $h_1[n]$  for a 1-barrel solera.

$$x[n] \longrightarrow \begin{bmatrix} 1-\text{barrel} \\ \text{solera} \end{bmatrix} \longrightarrow \begin{bmatrix} 1-\text{barrel} \\ \text{solera} \end{bmatrix} \longrightarrow y[n]$$
 Show that  $h_3[n] = ((h_1 * h_1) * h_1)[n]$ .

$$h_1[n] = \left(\frac{1}{2}\right)^n u[n-1] = \begin{cases} \left(\frac{1}{2}\right)^n & \text{if } n > 0\\ 0 & \text{otherwise} \end{cases}$$

No tracer leaves barrel #1 on the year the tracer is added (n=0). Half leaves the following year.

Half of the remainder leaves on each subsequent year.

The sum of all that leaves (from n=0 to  $\infty$ ) is 1 (all of it).

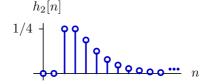

$$h_1[n] = \left(\frac{1}{2}\right)^n u[n-1]$$

$$h_2[n] = (h_1 * h_1)[n] = \sum_{m=-\infty}^{\infty} h_1[m]h_1[n-m]$$

$$= \sum_{m=-\infty}^{\infty} \left(\frac{1}{2}\right)^m u[m-1] \left(\frac{1}{2}\right)^{n-m} u[n-m-1]$$

The value being summed is zero unless  $m-1 \geq 0$  and  $n-m-1 \geq 0$ . Therefore  $1 \leq m \leq n-1$  and  $n \geq 2$ :

$$h_2[n] = \sum_{n=1}^{n-1} \left(\frac{1}{2}\right)^n = (n-1)\left(\frac{1}{2}\right)^n u[n-2]$$

$$h_1[n] = \left(\frac{1}{2}\right)^n u[n-1] \quad \text{and} \quad h_2[n] = (n-1)\left(\frac{1}{2}\right)^n u[n-2]$$

$$h_3[n] = (h_1 * h_2)[n] = \sum_{m=-\infty}^{\infty} h_1[m]h_2[n-m]$$

$$= \sum_{m=-\infty}^{\infty} \left(\frac{1}{2}\right)^m u[m-1](n-m-1)\left(\frac{1}{2}\right)^{n-m} u[n-m-2]$$

The value being summed is zero unless  $m-1 \geq 0$  and  $n-m-2 \geq 0$ . Therefore  $1 \leq m \leq n-2$  and  $n \geq 3$ :

$$h_3[n] = \sum_{n=0}^{n-2} (n-m-1) \left(\frac{1}{2}\right)^n = \frac{(n-1)(n-2)}{2} \left(\frac{1}{2}\right)^n u[n-3]$$
